**Roller-moulding fine fibrous velour finish on surface of extruded thermoplastic sheet - using plastic negative matrix casing on roller hair-fine conical moulding cavities, in conjunction with vacuum shi ensure complete filling by melt**

Assignee: **HCD HYGIENIC COMPOSITES DEV GMBH** Non-standard companyInventor: **WAGNER W;**Accession / Update: **1996-465799 / 200112**IPC Code: **B29C 41/26 ; B29C 41/50 ; B29C 43/22 ; B29C 41/24 ; B29C 47/12 ; B29C 47/32 ; B29C 47/88 ; B29D 7/01 ; B29L 7/00 ;**Derwent Classes: **A32;**Manual Codes: **A11-B07A(Of film and sheet) , A11-B07D(Associated processes) , A11-C04(Surface treatment) , A12-S07(Sheet)**Derwent Abstract: **(DE19524076C)** A velvety surface-structured sheet is made in this process, by applying molten thermoplastic to a temperature-controlled rotating cylinder. This roller has a surface, which is a negative mould for the required surface structure. The plastic is exuded onto this surface (5) over a front (17) parallel to the roller (4) axis. Complete contact is made, during which the plastic is structured and cooled, solidifying it. It is then pulled off the roller. The novel feature is exposure of the roller to a locally-reduced pressure, which is at a maximum just before the outflow front. This evacuates the matrix cavities just ahead of application, hence inducing the plastic, which largely fills them.**DERWENT RECORD**

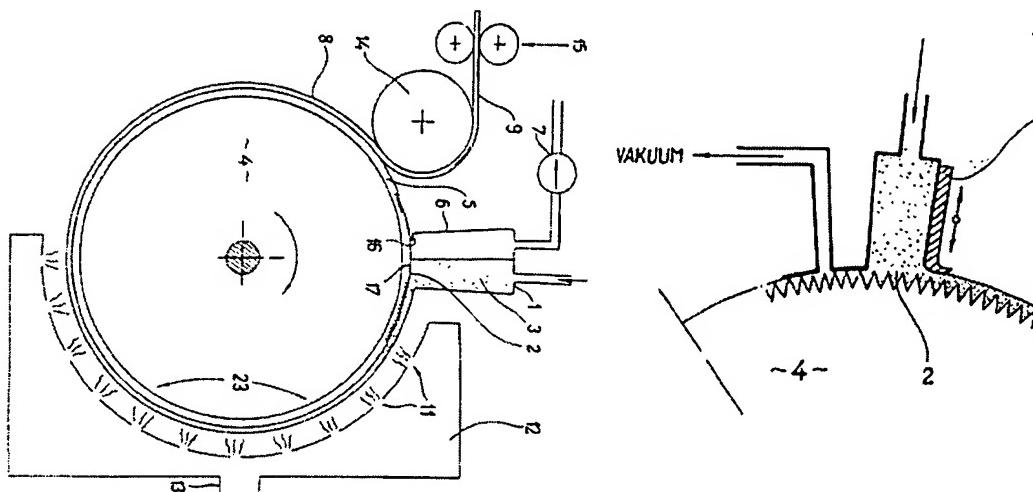

Also claimed is the appts. to make the sheet Pref. the reduced pressure between is 0.1-3.0 bar; pref. 0.1-0.3 bar. Cooling-off and hardening is effected over a roller rotation angle of some 180-300deg., by a forced cooling airflow. To make the velvet-surfaced product, esp. a plastic sheet, the matrix has numerous fine pores.

**Use** - To make a sheet thermoplastic with a finely structured surface.

**Advantage** - This process is capable of producing a great variety of structured surfaces, esp. a velour- or velvet type finish with numerous projecting fibrous lengths. Vacuum ensures that the surface matrix will be adequately filled by the plastic, allowing the production of very fine surface detail. Fibre lengths exceeding 3 mm, at diameters down to about 0.01 mm are feasible, with about 5000 laser-produced cavities per cm<sup>2</sup>. The product may be backed with reinforcing fabric. Six process examples are provided in the text.
